

Prompts

1. Design and implement a menu-driven 2D Graphics Editor in C using a 2D character array as a virtual drawing canvas.
2. Generate functions in C to draw graphical shapes such as rectangles, lines, triangles, and circles using ASCII characters.
3. Explain how coordinate-based drawing works in a terminal-based graphics editor.
4. Develop a modular C program using functions, loops, arrays, and switch-case statements for graphical operations.
5. Implement features to add, display, modify, and delete graphical objects from the canvas.
6. Create a clean and interactive terminal interface for navigating different drawing operations.
7. Generate a professional README.md file describing the project, features, technologies used, and execution steps.
8. Explain how Markdown formatting is used to improve GitHub project documentation.
9. Demonstrate how to create a GitHub repository and upload project files using Git and VS Code terminal.
10. Provide Git commands for staging, committing, and pushing files to a remote GitHub repository.

11. Explain how to compile and execute a C graphics program using GCC compiler commands.

12. Identify and solve common Git Bash errors encountered during project setup and GitHub integration.

13. Suggest creative future enhancements such as color support, file saving, animation, and undo/redo functionality.

14. Explain the importance of GitHub for version control, collaboration, and project management in software development.
